

WebHook data collector 1.xx

The webhook data collector is a small web-application running on Kubernetes, meant to test WebHook Notification channels for DX O2/APM.

Check the requirements in the github README.md file.

The installation is quite simple.

1. Build the image
2. Push the image to a repository
3. Check the yaml files, adapt as required (target FQDN in the ingress). Make sure there is a certificate associated to the FQDN or SSL check will cause a fail (DX O2/APM side)
4. Create a Admin secret as stated in the k8s/README.md file.
5. Update the yaml files that need to be updated -> Admin secret, service account if required.
6. Deploy the yaml files - wait for the application to show up.
7. Create a token - On the kubernetes server UI: <https://FDQDN/whdctokens.php>

- Welcome "Admin" - problems to Jörg Mertin -

Received Collector Token Manager

Tenant name	Owner E-Mail
Identifier:	Mail: Save

Registered tenant listing

Date	Tenant name	Owner E-Mail	Token
2025-01-22 14:45:36	itom-dx-demo-dev	joerg.mertin@broadcom.com	=> Show Token (# 1 rows)
2025-01-22 08:30:38	ting-24.11	ting.zhu@broadcom.com	=> Show Token (# 2 rows)
2025-01-21 17:03:53	csa-eu-mertin	joerg.mertin@broadcom.com	=> Show Token (# 26 rows)

8. Configure and apply the token in the WebHook Notification Channel UI in the DX O2 Settings. For a first test, you can also just execute the provided test_access.sh script. Make sure you update the token inside!
9. Go to the <https://FQDN/whdclist.php> page - enter the token into the Token field.

"Unauthenticated" - problems to Jörg Mertin -

Received WebHook alerts

Unauthenticated: Please submit the token identifier provided to your Webhook source!

Token identifier:

It will show you all submitted WebHook requests in a listing, providing you also the possibility to look at the provided header/get/post fields and json payloads.

Welcom "csa-eu-martin" - problems to Jörg Martin -	
Received WebHook alerts	
- The whdc lster will use "Alarm Status" and "Alarm Name" to build up the subject line. For Slack, it uses the "text" content. - Last 25 events will be shown. The system will delete old events automatically!
